

## Paint Solution to NZBC Health and Safety Concerns

Health and Safety are important factors that are currently being reviewed in the New Zealand Building Code. The current building code addresses the issues surrounding the release of VOC's into the indoor environment at room temperature. Dulux's Enviro<sub>2</sub> interior paint system is an excellent way to address this issue with its low VOC formula greatly reducing the impact on professional painters, and clients, allowing for a more pleasant painting environment as well as faster move back after work is carried out.

When David Reid Homes (Canterbury) Ltd built a recent show home in Hampton Grange, Christchurch, they specified high quality materials designed to have minimal impact on the indoor environment. Dulux Enviro<sub>2</sub> was the interior paint system that was specified for use. Painting contractors David Robertson Decorating carried out painting work and for them it was the first time using the product.

“We were so impressed with the product that it’s now our interior product of choice, we’re thrilled with the quality finish that the paint gives. It has exceptional opacity, is great for touch ups, and allows for a more pleasant painting environment,” said Russell Robertson of David Robertson Decorating.

The attention to detail and selection of quality products for this house earned David Reid Homes (Canterbury) Ltd recognition at the Registered Master Builders 2008 House of the Year Awards, taking the Lifestyle Award for Future Proof Building. Health and safety is a scored category of the award and David Reid Homes (Canterbury) Ltd had exhibited excellence in their thoughtful selection of materials that meet the principles of tomorrow.
