

High Performance Window Films, HPWF, supplied and installed the translucent adhesive films that carry these graphics, which are also replicated in red and gold motifs on some of the glass-fronted internal offices. Created with HPWF's film product called *Lateral...Film for the Creative Mind* the images are digitally printed directly onto either frosted, opaque or clear films to provide a flexible design solution.

The design was also used on the inside faces of the DoC building's street-facing windows. Here, transparent 2.5m x 400mm films in different colours punctuate the glazing to create a distinctive street effect and appear over three levels from Manners Street and over four levels from the Willis Street elevation.

The graphic film used on the atrium banisters, where visitor and staff traffic is high, has also been covered with a clear scratch-resistant film.

HPWF has extensive experience in project management for retail, commercial or industrial applications providing state-of-the-art design solutions with its Lateral Window Film.

The company also supplies the latest technology films for other applications such as Energy Control, Safety & Security solutions and Anti-Graffiti Film.
