

Viking Buzon Screwjack Pedestal System

Product Information

Description

Buzon screwjack pedestals are height-and-slope adjustable accessories made from UV stabilised high strength polypropylene, which support a deck surface; usually either a timber deck or paved surface, above (in most cases), a waterproofing membrane. Buzon pedestals range in height from just 17mm through to 620mm and the slope correction mechanism on top of the pedestal allows the deck surface to lay perfectly flat (0% slope) above the waterproofing membrane which slopes away from the building for drainage purposes.

Applications

Buzon pedestals are used for the smallest residential balcony projects through to large bridge walkways, industrial platforms or large civil projects for public spaces such as those requiring water and power reticulation below the ground which can be easily accessed.
