

 **VARI PITCH**
Pitch Ready Ridging

ROOFING INDUSTRIES LTD – “VARI PITCH” PITCH READY RIDGING

Predicted to revolutionise the way designers view roof ridge capping, Roofing Industries is pleased to announce the product availability of pitch ready round-top capping which will be known as “**Vari Pitch**” **pitch ready ridging**.

Due to current rollforming machine manufacturing limitations, roof ridge capping has traditionally been supplied at a fixed roof pitch angle thereby requiring the installer to forcibly open or close the angles of each leg to meet the roof pitch often resulting in unsightly deformation of the ridge capping and ruination of roof aesthetics. Previously and to overcome variation in pitch angles it has been common to manually fold the product, however for residential projects a square-top product was not aesthetically desirable. “Folded ridge capping” whether round-top or square-top is also further limited during manufacture by length, adding extra lap joints to the finished project and therefore the potential for roof leakage.

Fortunately, recent innovative rollforming technology made available exclusive to Roofing Industries and available across our 14 Branch locations now allows for the machine operator to quite simply dial-up a specified roof pitch ensuring the capping will fit “uniformly” on any roof with the added benefit in that there is no restriction on length. “**Vari Pitch**” **pitch ready ridging** is also manufactured utilising most traditional metal substrates, surface finishes and pre-painted colours.

Going forward, Roofing Industries will add “Vari Pitch” pitch ready ridging to our extensive suite of drawings so that the specifier can simply add pitch-ready requirements to any plan with the installer then ordering from Roofing Industries branches.
